AI SHORTCUT

FREE GUIDE · KEYWORD DEV

5 free add-ons that make your AI *code like a senior*

What each one fixes, how to install it, and when to skip it. All checked before we recommend them.

The 5 at a glance

Add-on	Fixes	Cost
Agent Skills	Codes before it plans	Free
Context7	Writes code for old library versions	Free key
Graphify	Gets lost in big projects	Free CLI
21st Magic MCP	Plain, ugly UI	Free search, paid AI generation
Strix	Ships security holes	Free + open source, uses your own AI credits

1. Agent Skills (by Addy Osmani)

Adds a full build cycle to Claude Code: spec, plan, build, test, review, ship. Skills are plain markdown, MIT licence.

```
/plugin marketplace add addyosmani/agent-skills
/plugin install agent-skills@addy-agent-skills
```

- Then start any feature with **/spec**, and finish with **/review** before you ship.

2. Context7 (by Upstash)

Gives your AI the current docs for any library (Next.js, Supabase, Stripe...), so it stops writing code for old versions. MIT licence. It sends library names and your question to context7.com, not your code.

```
npx ctx7 setup --claude
```

- Sign in with the free key when it asks (rate-limited, enough for normal use).

3. Graphify

Maps your whole codebase into a knowledge graph once, so the AI asks the graph instead of re-reading every file. Parsing runs on your computer.

- Get it from **github.com/Graphify-Labs/graphify** and follow the README install.
- Worth it for big projects. For a small site, skip it.

- The cloud version is a paid extra you don't need.

---

4. 21st Magic MCP

Search and add ready-made React + Tailwind components straight from your AI chat.

- Get it from **github.com/21st-dev/magic-mcp**; it needs a free account key from 21st.dev.
- Searching and adding components is free. AI-generated components need a paid plan.
- Your searches go to 21st.dev.

---

5. Strix (AI pentest)

AI agents that try to hack your own app in Docker and tell you what to fix. Apache licence.

```
pipx install strix-agent
export STRIX_TELEMETRY=0
```

- **Only test apps you own** or have written permission to test.
- Needs Docker, and every scan uses your own AI API credits.
- Use pipx (as above), not a curl | bash installer.

Our order

- Start with **Agent Skills** and **Context7**: biggest gain, 5 minutes.
- Add **Graphify** when a project gets big, **21st** for landing pages, **Strix** before launch.
